

5. Project Development Phase

Automated Network Request Management in ServiceNow

Project Name	Automated Network Request Management in ServiceNow
Platform	ServiceNow
Development Environment	ServiceNow Personal Developer Instance (PDI)

5.1 Development Overview

The development phase focuses on implementing the proposed solution in ServiceNow PDI. The project uses standard ServiceNow configuration and basic JavaScript to automate the network request lifecycle.

5.2 Development Components

S.No.	Component	Purpose
1	Service Catalog	Provides a simple form for users to submit network requests.
2	Catalog Variables	Collects required network request information.
3	UI Policies	Shows, hides, or controls fields based on request conditions.
4	Client Scripts	Performs basic client-side validation and form behavior.
5	Flow Designer	Automates request processing, approval, assignment, and notifications.
6	Business Rules	Provides simple server-side validation and automation.
7	Notifications	Sends request and status updates to users and teams.
8	SLA	Tracks response and resolution targets.
9	Reports & Dashboards	Provides request and SLA visibility.

5.3 Development Process

1. Create and access the ServiceNow Personal Developer Instance.
2. Create the Network Request Service Catalog item.
3. Create catalog variables for request information.

4. Configure mandatory and conditional fields.
5. Add basic Client Scripts and UI Policies.
6. Create the Flow Designer automation.
7. Configure approval and network team assignment.
8. Configure notifications and SLA tracking.
9. Create reports and dashboard.
10. Test the complete request lifecycle.

5.4 Network Request Form

The Service Catalog form captures the information required to process a network request.

- Request Type
- Business Justification
- Network / Access Details
- Required Date
- Additional Information

5.5 Basic JavaScript

Basic JavaScript is used only where required for form validation and dynamic behavior.

```
function onChange(control, oldValue, newValue, isLoading) {  
    if (isLoading) {  
        return;  
    }  
  
    if (newValue == 'VPN') {  
        g_form.setMandatory('access_reason', true);  
    }  
}
```

5.6 Flow Designer Automation

The basic automated flow is:

Request Submitted → Validate Request → Approval → Assign Network Team → Fulfillment
→ Status Update → Notification → Closure

5.7 User Roles

Role	Development / Process Responsibility
End User / Requester	Submit and track network requests.
Approver	Review and approve or reject requests.
Network Fulfillment Team	Process approved requests and update status.
IT Administrator	Configure ServiceNow components and automation.

5.8 Development Testing

- Verify catalog form submission.
- Verify mandatory and conditional fields.
- Verify approval and rejection.
- Verify automatic assignment.
- Verify notifications.
- Verify SLA tracking.
- Verify status changes.
- Verify request closure.
- Verify reports and dashboard.

5.9 Development Outcome

The development phase produces a working ServiceNow PDI-based solution that provides a standardized and automated process for submitting, approving, assigning, tracking, and closing network service requests.

5.10 Note

This project is developed and demonstrated in a ServiceNow PDI. Actual production deployment and direct network-device configuration are outside the basic project scope unless a separate target environment or integration is available.
