Automated Network Request Management in ServiceNow

1. Introduction

Project Title: Automated Network Request Management in ServiceNow

Team Members: _____

2. Project Overview

Purpose: This project automates and simplifies the handling of network-related service requests in ServiceNow. It provides a structured process from request submission to approval, fulfillment, tracking, and closure.

Key Features:

- Service Catalog for network request submission.
- Simple request form with mandatory and conditional fields.
- Automated approval workflow.
- Automatic assignment to the network fulfillment team.
- SLA tracking and escalation.
- Email notifications and status updates.
- Request tracking and closure.
- Reports and dashboards.

3. Architecture

The project uses a simple ServiceNow platform architecture suitable for a Personal Developer Instance (PDI).

Component	Technology / Purpose
User Interface	Service Catalog / Service Portal
Form Configuration	Catalog Variables, UI Policies
Client-side Logic	Basic JavaScript / Client Scripts
Server-side Logic	Business Rules
Automation	Flow Designer
Data	ServiceNow Platform Tables
Notifications	ServiceNow Notifications
SLA	ServiceNow SLA / Task SLA
Reporting	Reports and Dashboards

Simple Architecture Flow:

User → Service Catalog → Validation → Approval → Network Team → SLA / Notifications → Closure → Reports

4. Setup Instructions

Prerequisites:

- ServiceNow Personal Developer Instance (PDI).
- Basic knowledge of ServiceNow configuration.
- Basic JavaScript knowledge.

Basic Setup:

1. Access the ServiceNow PDI.
2. Create the Network Request Service Catalog item.
3. Create and configure catalog variables.
4. Configure UI Policies and Client Scripts.
5. Create the Flow Designer workflow.
6. Configure approval and assignment.
7. Configure notifications and SLA.
8. Create reports and dashboards.
9. Test the complete request lifecycle.

5. ServiceNow Component Structure

The project is organized using standard ServiceNow configuration components:

Service Catalog

- └─ Network Request Catalog Item
- └─ Catalog Variables
- └─ UI Policies
- └─ Client Scripts
- └─ Flow Designer
- └─ Business Rules
- └─ Notifications

└─ SLA
└─ Reports & Dashboards

6. Running the Project

The project is demonstrated directly in the ServiceNow PDI. A user submits a network request from the Service Catalog. The configured workflow then processes approval, assignment, notifications, SLA tracking, and closure.

Request Flow:

Submit Request → Validate → Approve / Reject → Assign → Fulfill → Update Status → Close

7. Automation Documentation

Main automation components:

- Flow Designer manages request processing and approval.
- Client Scripts provide basic form validation and dynamic behavior.
- UI Policies show, hide, or make fields mandatory.
- Business Rules provide simple server-side validation or automation.
- Notifications inform users and teams about important request updates.
- SLA tracks response and resolution targets.

8. Roles and Access

Role	Responsibility
End User / Requester	Submit and track network requests.
Approver	Review and approve or reject requests.
Network Fulfillment Team	Process approved requests and update status.
IT Administrator	Configure ServiceNow and manage automation.

9. User Interface

The user interface is provided through the ServiceNow Service Catalog. The request form contains simple fields for request type, business justification, network details, required date, and additional information.

10. Testing

Test scenarios:

- Submit a valid network request.

- Check mandatory field validation.
- Verify conditional fields.
- Verify approval routing.
- Approve and reject requests.
- Verify assignment to the network team.
- Verify notifications.
- Verify SLA tracking.
- Verify status updates and closure.
- Verify reports and dashboard data.

11. Screenshots / Demo

Screenshots can be added here to show the Service Catalog item, request form, Flow Designer, approval, fulfillment task, SLA, and reports/dashboard.

12. Known Issues

The project is designed for development and demonstration in a ServiceNow PDI. Actual network-device configuration is outside the basic scope unless a separate network integration is configured.

13. Future Enhancements

- REST integration with network tools.
- CMDB integration and improved configuration tracking.
- Automated network configuration updates where supported.
- Advanced analytics.
- Mobile request experience.
- Knowledge article recommendations.
- Chat-based request submission.

Conclusion

The Automated Network Request Management in ServiceNow project provides a simple and standardized way to manage network service requests. It reduces manual effort by automating request submission, approval, assignment, notifications, SLA tracking, and

closure. The project demonstrates how ServiceNow PDI and basic JavaScript can be used to build a practical IT service management solution.
