# Automated Network Request Management in ServiceNow

## Brainstorming & Idea Prioritization

| | |
|---|---|
| **Project Name** | Automated Network Request Management in ServiceNow |
| **Document** | Brainstorming & Idea Prioritization |
| **Phase** | 1. Ideation Phase |
| **Date** | 02-09-2026 |
| **Team ID** | |
| **Maximum Marks** | 4 marks |

## 1. Purpose

This document records the candidate ideas considered for solving the network-request problem, and the reasoning for prioritizing a ServiceNow Service Catalog + Flow Designer based solution.

## 2. Step 1 — Problem Statement Selected

See "01_Problem_Statement.docx": lack of a structured, trackable process for submitting and fulfilling network requests.

## 3. Step 2 — Ideas Considered

| Idea | Description | Considered Viable? |
|---|---|---|
| Shared email inbox | Route all requests to a shared team mailbox | No — no structured data, no approval trail |
| Spreadsheet tracker | Log requests manually in a shared spreadsheet | No — manual, error-prone, no automation |
| ServiceNow Service Catalog + Flow Designer | Structured catalog item captures request details; Flow Designer automates record creation, approval, and notification | Yes — selected |

## 4. Step 3 — Idea Prioritization

The ServiceNow-based approach was prioritized because it uses the organization's existing ITSM platform, provides built-in approval and notification mechanisms (Flow Designer), and creates an auditable backend record of every request without needing a separate custom application.

## 5. Status

Reflects the actual chosen direction for the project. **[IMPLEMENTED]**

## Define the Problem Statement

| | |
|---|---|
| **Project Name** | Automated Network Request Management in ServiceNow |
| **Document** | Define the Problem Statement |
| **Phase** | 1. Ideation Phase |
| **Date** | 02-09-2026 |
| **Team ID** | |
| **Maximum Marks** | 2 Marks |

## 1. Purpose

This document frames the problem that the "Automated Network Request Management in ServiceNow" project sets out to solve, from the point of view of the people who submit and process network requests within an organization.

## 2. Background

Organizations frequently receive ad-hoc requests from employees for network-related changes — for example, a new network connection, a relocation of an existing connection, or a change to networked device details. Without a structured system, these requests are often handled through email or verbal communication, which makes tracking, approval, and accountability difficult.

## 3. Customer Problem Statement

| Problem Statement (PS) | I am (Customer) | I'm trying to | But | Because | Which makes me feel |
|---|---|---|---|---|---|
| PS-1 | an employee/requester | submit a network request (new connection, relocation, or device change) through a standard channel | there is no single structured place to submit this and track its status | requests are handled informally over email/chat | uncertain about whether my request was received or is progressing |
| PS-2 | a member of the network fulfillment team | process incoming network requests efficiently | requests arrive without consistent information or an approval trail | there is no automated intake, approval, and record-keeping process | unable to prioritize and audit requests reliably |

## 4. Problem Statement (Narrative)

Employees who need a network-related change (new connection, relocation, or device update) currently lack a structured, trackable way to submit that request, get it approved, and see it fulfilled — resulting in delays, lost requests, and no audit trail. The project addresses this by providing a Service Catalog-based request form, an approval workflow, and a backend record of every request within ServiceNow.

## 5. Status

This problem framing reflects the stated purpose and rationale for building the project. **[IMPLEMENTED]**

## Empathy Map Canvas

| | |
|---|---|
| **Project Name** | Automated Network Request Management in ServiceNow |
| **Document** | Empathy Map Canvas |
| **Phase** | 1. Ideation Phase |
| **Date** | 02-09-2026 |
| **Team ID** | |
| **Maximum Marks** | 4 Marks |

## 1. Purpose

An empathy map captures what the primary user of the system — the employee submitting a network request — thinks, feels, says, and does, to help ground the design of the Network Request catalog item and workflow in real user needs.

## 2. Target User

Primary persona: An employee (requester) who needs a network connection set up, relocated, or a networked device updated.

## 3. Empathy Map

| Quadrant | Observations |
|---|---|
| Says | "I just need this request submitted quickly and I want to know someone is looking at it." |
| Thinks | "Will this get lost like the last email I sent to IT?" / "Who do I even ask for this?" |
| Does | Emails or messages the network/IT team directly; follows up manually to check status. |
| Feels | Uncertain, mildly frustrated by lack of visibility; relieved once status is confirmed. |

## 4. Goals and Pain Points

### Goals

- Submit a network request without needing to know internal routing/approval details.
- Get confirmation that the request was received.
- See the request move through approval and fulfillment.

### Pain Points

- No standard form — requests vary in completeness.
- No visibility into approval or fulfillment status.
- No audit trail if a request is disputed later.

## 5. Status

This empathy map is a design-thinking artifact used to motivate the catalog item and workflow design; it is conceptual and not derived from formal user research.
