Automated Network Request Management in ServiceNow

Customer Journey Map

Project Name	Automated Network Request Management in ServiceNow
Document	Customer Journey Map
Phase	2. Requirement Analysis
Date	02-09-2026
Team ID	

1. Purpose

This journey map traces the requester's experience end-to-end, from recognizing a network need through to completion and notification, based on the actual submission and Flow Designer process.

2. Journey Stages

Stage	User Goal	User Action	Touchpoint	User Experience	Pain Point	System Response	Improvement Opportunity
1. Need Identified	Resolve a network issue/need	Recognizes need for new/changed network connection	N/A (offline)	Aware something needs to change	No easy way to know where to submit a request	N/A	Publicize the catalog item's location
2. Find Network Request	Locate the right form	Opens Service Portal, searches/browses Service Catalog	Service Portal	Should be straightforward if catalog is well-categorized	Item not found if catalog category is unclear	Displays 'Network Request' under Network category	Ensure clear categorization/search keywords
3. Fill Request Form	Provide request details	Selects Connection Type, enters Address/Device Details, etc.	Network Request catalog item	Dynamic fields reduce clutter	Unclear which fields are mandatory	UI Policy shows/hides fields based on Connection Type	Clear field labels and help text
4. Provide Requester Info	Confirm who the request is for	Selects 'Opened on behalf of'; email/name/phone auto-populate	Network Requester Information variable set	Convenient — auto-population reduces effort	Auto-populated fields not editable if incorrect	Dot-walks from selected user record	Confirm auto-populated data is read-only by design
5. Submit Request	Send the request for processing	Clicks submit	Service Catalog	Straightforward, one action	No immediate confirmation of what happens next	Flow Designer flow triggers	Add on-screen confirmation message
6. Wait for Approval	Get request approved	Waits (passive)	N/A	Uncertain how long approval will take	No visibility into approval status without checking ServiceNow	Ask For Approval step routes record	Status-tracking view for requesters
7. Network Team	Get request fulfilled	N/A (handled by Network Team)	Assignment Group /	Relies on Network Team's own workflow	No visibility into	Record assigned to Network	Provide fulfillment status field

Stage	User Goal	User Action	Touchpoint	User Experience	Pain Point	System Response	Improvement Opportunity
Processing			Assigned to fields		fulfillment progress	Team via lookup	
8. Completion & Notification	Learn the request is done	Receives email notification	Email	Reassuring closure to the request	Email content may be generic	Send Email step notifies stakeholder	Include request number and outcome in email

3. Status

Stages reflect the actual submission and Flow Designer sequence; user-experience/pain-point columns are conceptual (not derived from formal user research).

Automated Network Request Management in ServiceNow

Data Flow Diagram & User Stories

Project Name	Automated Network Request Management in ServiceNow
Document	Data Flow Diagram & User Stories
Phase	2. Requirement Analysis
Date	02-09-2026
Team ID	
Maximum Marks	4 Marks

1. High-Level Data Flow

The diagram below (see "09_Proposed_Solution_and_Architecture.docx" for the full architecture diagram) summarizes how data moves through the system:

1. Requester submits the Network Request catalog item via the Service Portal / Service Catalog, providing catalog variables and requester information.
2. Flow Designer's 'Get Catalog Variables' step retrieves the submitted values from the Requested Item.
3. A record is created in the Database Tables table (auto-numbered with the ANR prefix, 7 digits).
4. A Look Up Record step retrieves the Network Team group from the Group [sys_user_group] table and sets it as the Assignment Group.
5. An email notification is sent.
6. The flow requests approval on the record.
7. Depending on the approval outcome, the Database Tables record is updated (approved branch or rejected branch).

2. User Stories

User Type	Epic	ID	User Story	Priority
Requester	Request Submission	USN-1	As a requester, I can submit a network request through the Service Catalog so that my request is logged and tracked.	High
Requester	Requester Info Capture	USN-2	As a requester, my email, name, and phone number are auto-populated from my user record so I don't have to re-enter them.	High
Requester	Dynamic Form	USN-3	As a requester, I only see the additional fields relevant to my selected connection type.	Medium
Approver	Approval	USN-4	As an approver, I receive the request for approval so I can approve or reject it.	High
Network Team	Fulfillment	USN-5	As a member of the Network Team, the request is automatically assigned to my group once approved.	High
Requester	Notification	USN-6	As a requester, I receive an email notification about my request.	Medium

3. Status

Flow sequence reflects the actual Flow Designer steps described for this project. **[IMPLEMENTED]**

Automated Network Request Management in ServiceNow

Solution Requirements (Functional & Non-Functional)

Project Name	Automated Network Request Management in ServiceNow
Document	Solution Requirements
Phase	2. Requirement Analysis
Date	02-09-2026
Team ID	
Maximum Marks	4 Marks

1. Functional Requirements

FR No.	Functional Requirement (Epic)	Sub-Requirement	Status
FR-1	Network Request Submission	Requester submits a request via the Network Request Service Catalog item	IMPLEMENTED
FR-2	Requester Information Capture	Requester details (opened on behalf of, email, name, phone) captured via the Network Requester Information variable set	IMPLEMENTED
FR-3	Dynamic Form Behavior	Catalog UI Policy controls visibility of fields based on selected Connection Type	IMPLEMENTED
FR-4	Backend Record Creation	A record is created in the Database Tables table for each submitted request	IMPLEMENTED
FR-5	Approval Routing	Flow Designer routes the request for approval before fulfillment	IMPLEMENTED
FR-6	Assignment to Network Team	Request is assigned to the Network Team group via a lookup on the Group table	IMPLEMENTED
FR-7	Email Notification	An email is sent at a key stage of the request lifecycle	IMPLEMENTED
FR-8	Status Update on Approval/Rejection	Database Tables record is updated depending on the approval outcome	IMPLEMENTED
FR-9	Reporting / SLA Visibility	Dashboards or SLA definitions for request tracking	NOT VERIFIED

2. Non-Functional Requirements

NFR No.	Non-Functional Requirement	Description	Status
NFR-1	Usability	Requesters submit requests through the standard Service Catalog UI without additional training	IMPLEMENTED
NFR-2	Auditability	Every request is persisted as a record with a unique auto-generated number (ANR-prefixed)	IMPLEMENTED
NFR-3	Maintainability	Built using out-of-the-box ServiceNow constructs (Catalog, Variable Sets, UI Policy, Flow Designer) for ease of handover	IMPLEMENTED
NFR-4	Reliability	Formal reliability/performance testing (load, concurrency)	NOT VERIFIED
NFR-5	Security / Access Control	Role-based access control (ACLs) on the catalog item and table	NOT VERIFIED

3. Notes

Requirements are drawn from the actual configured catalog item, variable set, UI Policy, and Flow Designer flow. Items marked NOT VERIFIED were part of general ServiceNow project expectations but are not confirmed as implemented for this project and should not be presented as implemented.

Automated Network Request Management in ServiceNow

Technology Stack (Architecture & Stack)

Project Name	Automated Network Request Management in ServiceNow
Document	Technology Stack
Phase	2. Requirement Analysis
Date	02-09-2026
Team ID	
Maximum Marks	4 Marks

1. Components & Technologies

S.No	Component	Description	Technology
1	User Interface	How the requester interacts with the system	ServiceNow Service Portal / Service Catalog
2	Application Logic	Request intake, dynamic form logic, record creation, approval routing	ServiceNow Flow Designer, Catalog UI Policy
3	Database	Storage of request records	ServiceNow platform table: Database Tables
4	Reference Data	User and group data used for requester info and assignment	ServiceNow sys_user, sys_user_group tables
5	Notifications	Email notifications to stakeholders	ServiceNow Flow Designer Send Email action
6	Infrastructure	Hosting environment	ServiceNow Personal Developer Instance (PDI)

2. Application Characteristics

S.No	Characteristic	Description	Status
1	Low-Code / No-Code Platform	Built primarily using declarative ServiceNow tools (Catalog, Flow Designer, UI Policy) rather than custom scripts	IMPLEMENTED
2	Security Implementation	Role-based ACLs, encryption, or additional access controls	NOT VERIFIED
3	Scalable Architecture	Multi-instance or load-balanced deployment	NOT VERIFIED — PDI is a single-instance developer environment
4	Availability	High-availability configuration	NOT VERIFIED
