Maximum Marks	2 Marks

1. Customer Segment

Employees who need to request a new network connection, relocate an existing one, or update device details, and the network fulfillment team who process those requests.

2. Jobs-to-be-Done / Problems

- Submit a network-related request in a structured, trackable way.
- Get the request approved by the right person before it is actioned.
- Have the request routed to and fulfilled by the correct team.
- Retain an auditable record of the request and its outcome.

3. Available (Prior) Solutions

Email or verbal requests to the IT/network team; manual spreadsheet tracking. Both lack structured intake, automated approval routing, and a persistent auditable record.

4. Root Cause

There was no dedicated, structured intake mechanism for network requests within the organization's existing systems, so ad-hoc channels (email, chat) were used by default.

5. Your Solution

A ServiceNow Service Catalog item ("Network Request") captures structured request data, a Flow Designer automation creates a backend record, routes the request for approval, assigns it to the Network Team, and sends notifications — giving the process structure, approval control, and auditability without a separate custom application.

6. Status

Reflects the actual implemented solution direction. **[IMPLEMENTED]**

Automated Network Request Management in ServiceNow

Proposed Solution & Solution Architecture

Project Name	Automated Network Request Management in ServiceNow
Document	Proposed Solution & Solution Architecture
Phase	3. Project Design Phase
Date	03-09-2026
Team ID	

1. Proposed Solution Overview

The solution is implemented entirely on the ServiceNow platform (Personal Developer Instance) using the following building blocks:

- Network Request — Service Catalog item, in the Network category, that requesters use to submit requests.
- Network Requester Information — a reusable variable set capturing requester details, with fields auto-populated via dot-walking from the selected user record.
- Catalog UI Policy — controls dynamic show/hide behavior of fields based on the selected Connection Type.
- Database Tables — the backend table storing each request as a record, with ANR-prefixed, 7-digit auto-numbering.
- Network Request — the Flow Designer flow that creates the record, looks up the Network Team group, sends an email, and routes the request for approval.

2. High-Level Process Flow

Requester → Service Portal / Service Catalog → Network Request Form → Validation / Dynamic Form Behavior → Request Record Creation (Database Tables) → Approval → Fulfillment / Network Team Processing → Status Updates → Completion → Notifications.

3. Solution Architecture Diagram

[Diagram: Requester → Service Portal → Network Request Catalog Item → Catalog UI Policy (dynamic fields) → Flow Designer (Get Catalog Variables → Create Record in Database Tables → Look Up Network Team → Send Email → Ask For Approval → Approved/Rejected branch → Update Record) → Network Team Fulfillment]

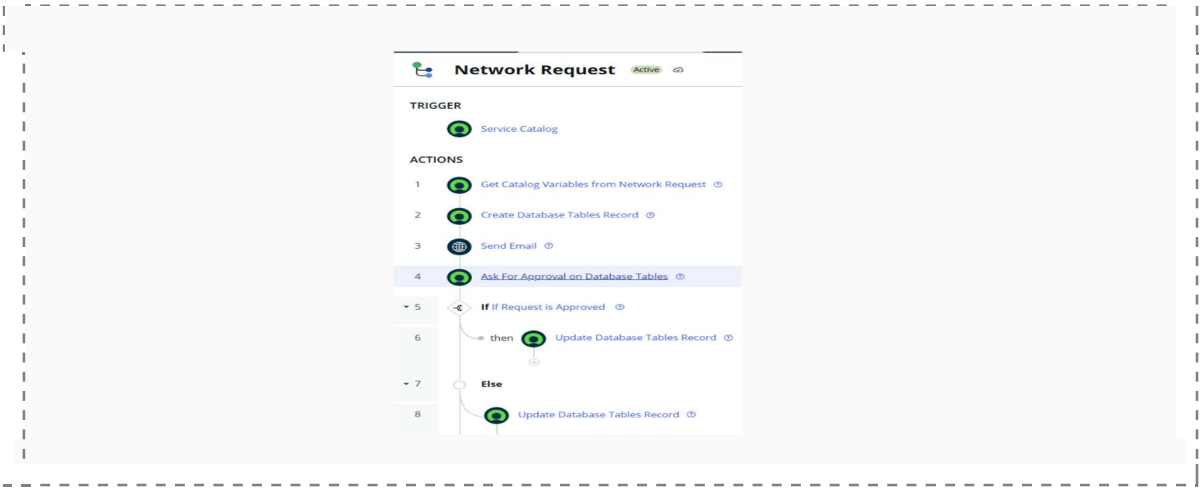

Figure 1 — ServiceNow System Architecture / Solution Diagram

What this proves: *That the end-to-end architecture matches the design described above.*

4. Status

Architecture reflects the actual implemented components. **[IMPLEMENTED]**
